

PORTFOLIO OF WORK · 2026

Pitsamorn Ingkavara

พิศสมร อิงควาระ

SAP S/4HANA Test Manager · Digital Transformation Programme Manager
Data Governance & Management Specialist

16+ years delivering enterprise SAP and data programmes across PTT Group

Bangkok, Thailand · Open to hybrid (WFH + on-site) engagements across Thailand & SEA

+66 86 495 6993 · pingkavara@gmail.com · [linkedin.com/in/pitsamorn-ingkavara](https://www.linkedin.com/in/pitsamorn-ingkavara)

AT A GLANCE

Three disciplines, one delivery record

Most transformation programmes source test management, programme management and data governance from three different people. I have led all three on the same estate — which is why quality gates, scope control and data readiness stay aligned instead of colliding at go-live.

Figures drawn from programmes delivered at PTT Global Chemical, PTT Exploration & Production, Thai Oil and PTT Digital Solution.

What I am hired to own

PILLAR 01

S/4HANA Test Management

- Test strategy & master test plan
- SIT / UAT execution & test directorship
- Entry & exit criteria governance
- Defect triage, RCA & escalation
- Legacy integration & cutover readiness
- Jira / Xray, Tosca, automated dashboards

Proof: UAT Test Director, 7 workstreams, ~4,060 test cases, 8 legacy applications integrated.

PILLAR 02

Digital Transformation Programme Management

- Programme & portfolio governance
- Steering Committee reporting
- As-is / To-be E2E process architecture
- Fit-to-standard & formal change control
- Legacy disposition & vendor/licence management
- Waterfall, Agile/Scrum & hybrid delivery

Proof: VMCS — 8 vendor touchpoints consolidated into 2 portals across 3 modules.

PILLAR 03

Data Governance & Management

- DG operating model, policy & standards
- Data domain & stewardship enablement
- Critical Data Elements & DQ rule design
- DQI measurement & remediation
- Metadata, lineage, catalog & access control
- Data classification, PDPA & security-by-design

Proof: 39 domains governed; 98.80% DQI over 132 rules and 5.99M records.

UAT Test Director on an enterprise S/4HANA transformation

PTT Global Chemical · 2024 – Present · Test Manager and PTP Legacy Integration Manager

The mandate

Own the quality gate for a strategic, multi-workstream S/4HANA programme — and prove readiness to a Steering Committee that had to approve go-live on evidence, not opinion.

- Test strategy, master test plan and test-cycle design
- SIT and UAT execution across 7 functional workstreams
- Defect triage, root-cause analysis and escalation
- Entry and exit criteria definition and enforcement
- Legacy integration and cutover readiness verification

Scope governed

Workstreams	RTR · OTC · PTP · MTS · PPD · PTA · Cross-function
UAT test cases	~4,060 in a single governed cycle
Legacy applications	8 integrated for the Procure-to-Pay workstream
Governance	Daily burn-down, defect ageing, weekly checkpoint, Steering Committee reporting
Tooling	Jira / Xray, Tosca, Power BI, Python + Jira REST API

7

Functional workstreams under one test governance model

~4,060

Test cases planned, executed and tracked to exit criteria

8

Legacy applications integrated and cutover-verified (PTP)

2–4 wks

Earlier risk visibility versus conventional reporting cycles

AI-augmented test and PMO reporting

The differentiator: I do not only manage the test cycle, I build the instrumentation that makes it visible. Jira REST API pipelines, Python analytics and Power BI replaced a manual reporting routine.

What was built

- **Jira-connected live dashboards** — overall UAT test-case status, per-workstream progress, planned vs. actual burn-down
- **Defect ageing & delay-analysis analytics** — surfacing slippage before it becomes an escalation
- **Automated UAT scheduler** — cycle planning and resource allocation per workstream
- **Issue auto-notification** — routing open UAT issues to named owners without manual chasing
- **Executive checkpoint pack** — generated, not assembled by hand

Toolchain

Jira REST API · Python · Power BI · Microsoft Copilot · UiPath · agentic AI workflows for status consolidation and risk detection.

Why it matters to a programme

Traditional PMOs spend their capacity producing the report. Automating production moves that capacity into reading the signal — which is where risk is actually caught.

~95%

Less status reporting effort — 1 day reduced to ~15 minutes

~50%

Less PMO administrative overhead through automation

98%

Issue traceability with zero manual follow-up

2–4 wks

Earlier foresight on emerging delivery risk

VMCS — from 8 vendor touchpoints to 2 connected portals

Vendor Management & Collaboration System · PTT Global Chemical group · Owned the as-is / to-be E2E architecture and legacy disposition strategy.

TODAY · 8 TOUCHPOINTS

- Paper vendor registration
- GEP vendor registration
- GCME vendor management
- Smart Work Request
- PO Tracking
- Shipping Management
- Smart Receiving
- Payment Tracking

8 systems · 4 registrations · 3 logins — and no single view of the vendor.

WITH VMCS · 2 PORTALS

FOR INTERNAL USERS

Vendor Management Component

- **Register & govern** — one registration, automatic duplication check, one approval workflow
- **Manage performance** — vendor profiling, categorisation and performance tracking
- **Gain visibility** — vendor search, reporting and spend analytics

FOR VENDORS

Vendor Collaboration Component

- **One login** — a single account for every vendor activity across the group
- **Transact in one place** — RFQ, PO, shipping, receiving and invoicing
- **Track in real time** — transaction and payment status, end to end

No paper forms

One vendor identity

Full lifecycle coverage

Three modules, end-to-end functional scope

Each module was scoped against existing reusable features versus genuinely new development, with mandatory/optional flags and integration points identified up front — the basis for realistic sizing and vendor negotiation.

MODULE 1

Vendor Collaboration Portal

Discovery	Business partner profile, RFP/RFI opportunities, workflow status
Account	New account request, self password, account management
Registration	Registration request, credit scoring, mandatory documentation, bank guarantee
Collaboration	Shipping documents, PO tracking, invoice submission, delivery & payment tracking
Compliance	PDPA consent, RBAC, permission assignment, event & audit log

MODULE 2

Vendor Management Portal

AVL	AVL & non-AVL search and report, AVL workflow and vendor status
Qualification	Credit scoring, criticism management, categorisation, shareholder checklist
On/Off-boarding	Request approval, approve/reject workflow, dashboard & report
Performance	Per-PO evaluation, annual evaluation, performance report
Risk & access	Business record, PDPA third-party assessment, RBAC, event log

MODULE 3

Procurement Operation Support

Work request	Request creation, quotation record & validation, approval, PR/PO mapping
PO tracking	PO search, acknowledge status, dashboard, status request, follow-up
Delivery	Stock/non-stock booking, approval, acknowledge, alerts, report & dashboard
Receiving & shipping	Commitment setup, goods/service receipt, penalty, reject/return, shipment list
Payment	Vendor bill search, paid bills, vendor action log, status report

As-is to To-be: the legacy disposition decision

The hard part of a transformation is not the new platform — it is deciding, application by application, what happens to what already exists, and sequencing it around contracts that are already expiring.

Disposition framework applied across the PTP estate

Decision	Applied to
A · Move to S/4HANA	Functionality that belongs in the core — Smart Accrual, Smart Receiving, Bank Guarantee
B · Re-integrate	Mature specialist tools retained and re-interfaced — WMRO+, MMOS1 (XHQ), GMM, ITAS, LIMS
C · Re-design / re-build	Fragmented vendor-facing systems rebuilt into VMCS — registration, PO tracking, work request, shipping, payment tracking
D · Report & analytic	Reporting-only consumers moved to the data platform rather than rebuilt
Retire	Redundant systems decommissioned with the process they supported

E2E process scope mapped

Eight numbered process steps traced end to end with their system, integration and data touchpoints:

- ① Purchase Requisition process
- ② PO Sourcing / Quotation
- ③ PO Contract Management
- ④ PO Purchase Order Management
- ⑤ Goods receipt referencing Purchase Order
- ⑥ AP Invoice verification
- ⑦ AP Payment
- ⑧ PO Vendor Management

Sequenced against contract reality

Transition planned around the GEP contract expiry (Sep 2025) and the Ariba downstream contract expiry (Aug 2026), plus the go-live dates of dependent legacy programmes.

Upstream demand mapped from PM, PP, CS, PS, IM/MRP and SD; downstream integration to QM, WM, TR Treasury, AA Asset Accounting and Budget Management.

Building a data governance foundation, then making it BAU

PTT Global Chemical · 2019 – 2023 · Data Governance & Management Lead. Six workstreams driven in parallel from foundation to sustained operation.

2020

Develop foundation

- ✓ DG organisation & operating model established
- ✓ DG policy, standards, procedures and templates
- ✓ Metrics and measurement formulas defined
- ✓ Knowledge developed organisation-wide
- ✓ Data management tooling assessed
- ✓ Data Quality Index established

2021

Adopt critical data domains

- ✓ Data stewardship engagement launched
- ✓ DG policy announced, deployment process live
- ✓ CDE, DQ rules, metadata and data access established
- ✓ Data literacy and stewardship capability built
- ✓ Data platform implemented
- ✓ >40% DQ implemented for SAP master data

2022

Scale out adoption

- ✓ Data stewardship announced — sprint 1, 6 data domains
- ✓ Standards and procedures announced
- ✓ DQ rules implemented on tooling
- ✓ Online training deployed organisation-wide
- ✓ Data integration & management tooling implemented
- ✓ >60% accumulated DQ for SAP master data

2023 →

Sustain operation

- BAU operational support in place
- DG and DI standardisation
- 22 data domains accumulated, prioritised by use case
- Stewardship sprint 2 — 16 further data domains
- Informatica migration
- >80% accumulated DQ for SAP master data

Workstreams run in parallel: organisation · policy, process & standards · data product delivery · communication & change management · data management technology · DG adoption for SAP data sources.

39 data domains governed — and measured every month

Governance only counts if it produces a number an executive can act on. The DQI framework and measurement formulas I established run continuously against SAP and data-lake sources.

98.80%

Data Quality Index against a 98.00% target

132

Business rules executed across the estate

5.99M

Records processed per measurement cycle

39

Enterprise data domains identified and mapped

Quality by data domain

Domain	Rules	DQI
Material spare-part	25	98.38%
Lab operation	41	97.76%
Accounting data	16	96.57%
Equipment & plant maintenance	67	95.96%
Vendor	26	95.93%
Raw material	67	94.89%
Customer & partners	10	90.44%

Domains classified for PDPA sensitivity (personal and sensitive personal data) and sequenced for adoption by use-case priority across 2024–2025.

The governance artefacts behind the number

Policy architecture authored

Tier 1 — DG Policy: governance charter, role identification, certification, council and working-group management, exception and waiver process, DG standards.

Tier 2 — Supporting policies: content handling, metadata guideline, data security, data quality, reference & master data management, data classification, data sharing agreement, data discovery profiling.

Tier 3 — Procedures: CDE identification, DQ rule definition, data quality management, data issue management.

Operating model — four options put to the executive

1 · Distributed	Deep business know-how, but high processing time
2 · Centralised	Specialised capability, but hard to facilitate across BUs
3 · Hybrid	Centralised for cross-BU data areas; mixed and adjusted to business need, but role and responsibility are harder to standardise
4 · Outsourced	Quick start-up, but capability stays with the consultant

Structure: Executive Sponsor → Chief Data Officer → Chief Data Lead → Data Leads → Data Stewards, with Demand & Programme Lead and DG PMO.

Data quality management process

A six-role controlled process designed and documented end to end — Data Quality Analyst, Data Governance Officer, Data Custodian, Data Quality Developer, Business Data Steward and Data Owner.

- Monthly DQ report generation and issue detection
- Request routed to technical data steward via IT-SR
- DQ rule review and IT script implementation
- Business steward review and approval cycle
- Data owner sign-off, or return to remediation
- Centralised DQ reporting to close the loop

Delivered alongside the data platform stack: data integration, ingestion, cloud and on-premise storage, data product service and advanced self-service analytics — with 2023 delivery focused on API-based data services for project use-cases and data science teams.

TRACK RECORD

Sixteen years on one of Thailand's largest SAP estates

2024 – Present	PTT Global Chemical PCL	TESTINGINTEGRATION	S/4HANA Test Manager (UAT Test Director) · PTP Legacy Integration Manager — 7 workstreams, ~4,060 test cases, 8 legacy applications, Steering Committee reporting.
2023 – 2025	Thai Oil PCL	DATA GOVERNANCEPMO	Data Governance & Security Lead / PMO — data classification, content handling standards and governance-by-design controls embedded into project delivery.
2023	PTT Exploration & Production PCL	PROGRAMMEPMO	S/4HANA PMO Lead and Project Manager, GEP Smart — post-assessment consolidated into a prioritised roadmap; source-to-pay implementation and licence management.
2019 – 2023	PTT Global Chemical PCL	DATA GOVERNANCEDATA PLATFORM	Data Governance & Management Lead — operating model, policy architecture, 39 data domains, DQI framework, stewardship enablement and data platform delivery.
2009 – 2019	PTT Digital Solution Co., Ltd.	PROGRAMMESAP DELIVERY	SAP & Legacy Project Manager — SAP ERP (ECC / S/4HANA) and Ariba implementations across GC, Thai Oil, HMC and IRPC, specialising in P2P and S2C integration.

Education

M.Sc. Information Technology (Information Systems), KMITL — 2009–2011
B.Sc. Information Science (MIS), Walailak University — 2004–2007

Languages & working model

Thai (native) · English (professional working proficiency). Open to hybrid engagements combining remote delivery with on-site programme presence, across Thailand and SEA.

HOW I WORK

Quality gates, scope control and data readiness managed as one problem

Go-live failures rarely come from one discipline. They come from a test cycle that cannot prove readiness, a scope that changed without a decision, or master data that was never governed. Having owned all three, I build programmes where those three signals are visible in the same place, at the same time — instrumented, automated, and put in front of the people who have to decide.
